

Figure S2. Plate-based assay evaluated with HSA and OVA exhibits poor reproducibility. (A) Evaluation of the plate-based ELISA assay with ovalbumin produced a modest correlation with the standard assay ($r = 0.71$) and classification accuracy (88%) yet had high variation between repeats. (B) Variations between repeats were even more substantial for human serum albumin which produced a poor correlation ($r = 0.17$) and poor classification accuracy (72%).
